

Backup Arx One

This tutorial enables you to activate Arxone backup monitoring on your Esia.

Introduction

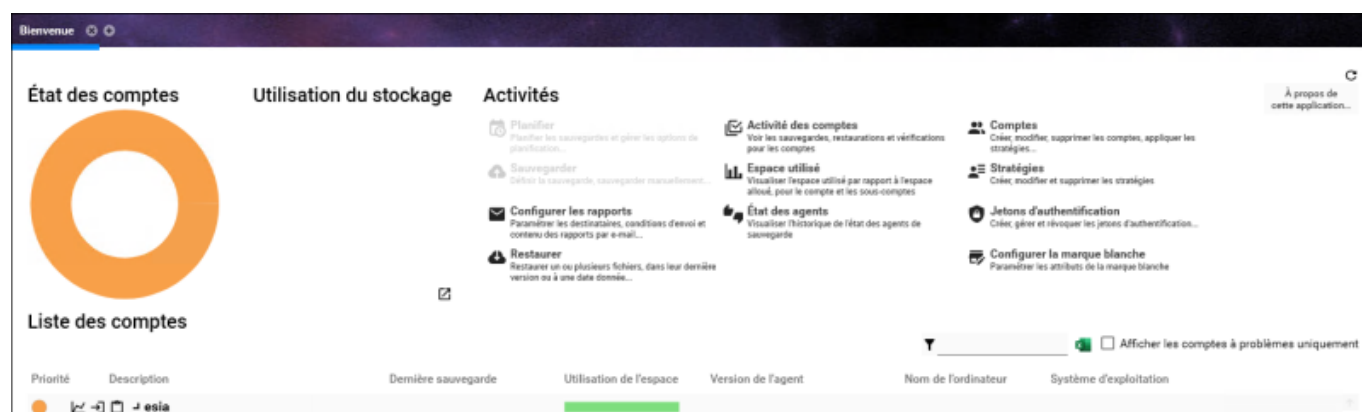

Arxone greatly simplifies the use of its backup systems by managing all its agents from its servers. So there's no configuration page on your Unity: everything is done from your Esia, in our cloud or hosted on your premises.

All you need is the access token for your group of Arxone nodes. You'll then see in Esia the backups of the child devices in that node group.

On your Arx One backup management console

Console home page

From the Arxone console home page, top right click on **Authentication Token**.

Token management page

Then click on **Generate a token** (in orange on the right).

Bienvenue

Jetons d'authentification

Les jetons d'authentification permettent de communiquer avec l'API de l'application. Pour plus d'information rendez-vous sur la documentation : <https://api.arx.one/openapi/>

Générer un jeton

Description	Date d'expiration	Droits	
	5/6/2026	X Master X Share X Report X BackupAgent	X Administration X Supervision X Lock Data X ChangeTrack X Configuration X Servers X Security X Administration.CreateAccount Supprimer

Configuring the authentication token

Here is an example of how to configure a token (**Warning**all fields are important) :

- **Description** Allows you to find the token in the Arxone console if you want to delete it later.
- **Expiry date** This is important because Esia will no longer be able to access Arxone after this date.
- **Access rights** access rights: read **read only** on the following sections : **Administration, Data, Supervision.**

Génération du jeton d'authentification
