

IP Label's Ekara

We're going to look at how to create and retrieve the elements needed to create a link between your ESIA system and IP Label's Ekara.

Introduction

IP label's Ekara is a “Real user Monitoring” platform. It enables you to carry out end-to-end monitoring as well as user feedback, from several different geolocations. You can create interaction scenarios with your applications.

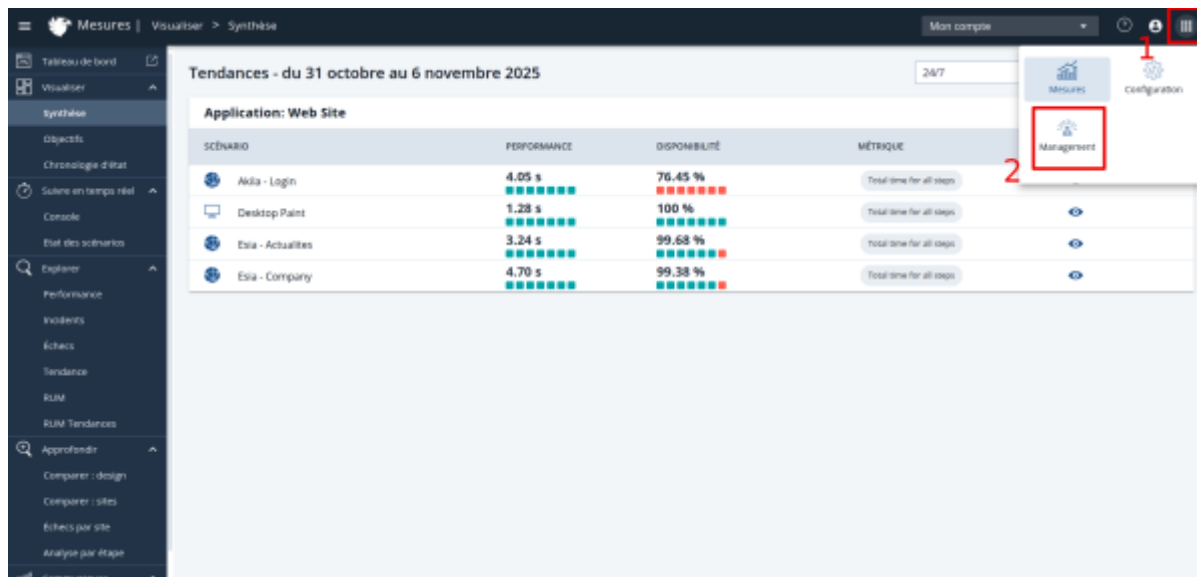

This allows you to perfectly complement your Esia monitoring with user experience data.

Creating API keys

You need to start by creating an API key to link your Esia to Ekara.

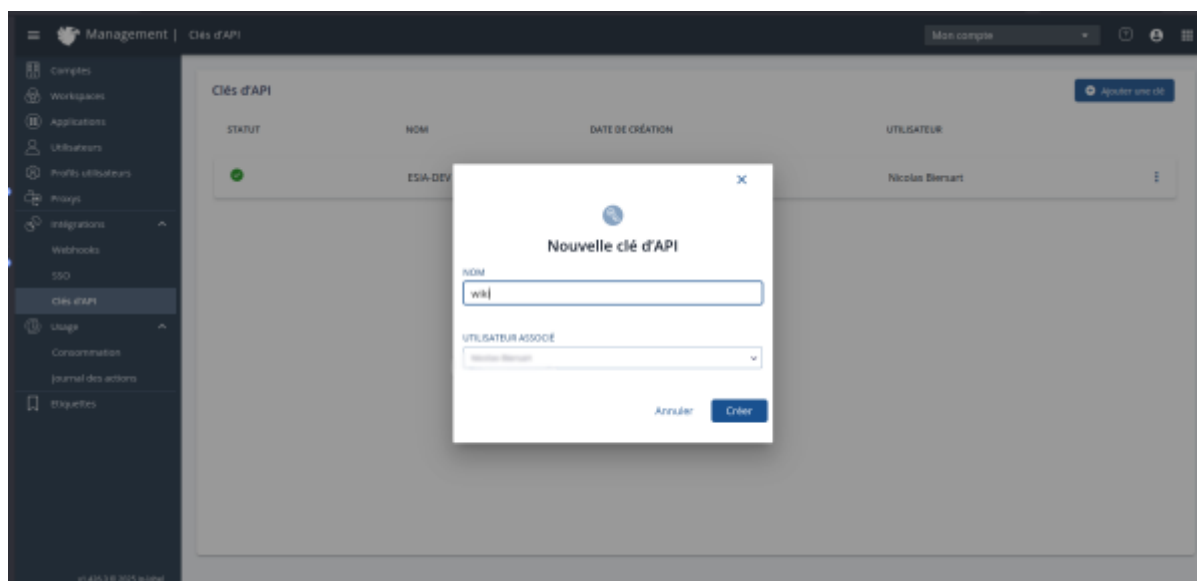

Log on to your Ekara interface and click on the icon with the 9 boxes (red box) in the top right-hand corner and then on “management”.

Then click on “API key” and “Add a key”.

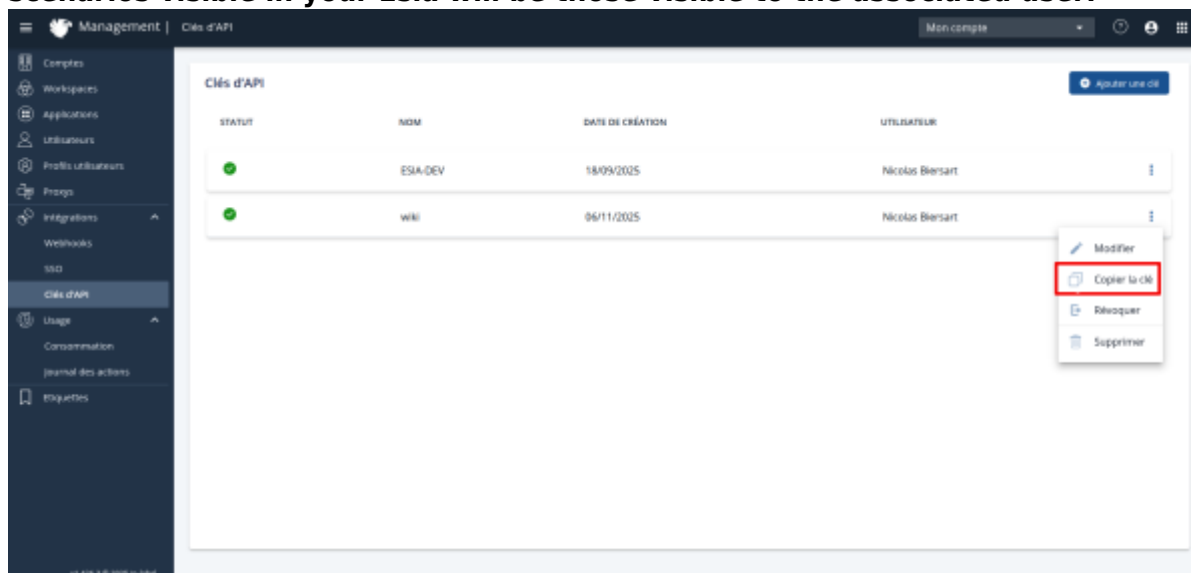

Fill in the name and user associated with the key

Then click on the 3 small dots on the right and finally “Copy the key”. **Please note that the**

scenarios visible in your Esia will be those visible to the associated user.

You can now go to your Esia and install the IPLabel module.

Installing and configuring the IP Label web plugin
